License GPL (>= 2)
Encoding UTF-8
Title Functions to Make Surveys Processing Easier
Description Set of functions to make the processing and analysis of
      surveys easier: interactive shiny apps and addins for data recoding,
      contingency tables, dataset metadata handling, and several convenience
      functions.
Depends R (>= 2.10)
Imports shiny (>= 1.0.5), miniUI, rstudioapi, highr, classInt,
      htmltools, graphics, stats, utils, labelled (>= 2.0.0)
Suggests memisc, testthat, roxygen2, dplyr, tidyr, janitor, forcats,
SystemRequirements xclip (Linux)
VignetteBuilder knitr
URL https://juba.github.io/questionr/
BugReports https://github.com/juba/questionr/issues
RoxygenNote 6.1.1
NeedsCompilation no
Author Julien Barnier [aut, cre],

addNAstr

Transform missing values of a factor to an extra level

Description

This function modifies a factor by turning NA into an extra level (so that NA values are counted in tables, for instance). This version of addNA extends the same function provided in R by allowing to specify a string name for the extra level (see examples).

Usage

```
addNAstr(x, value = "NA", ...)
```

Arguments

x a vector of data, usually taking a small number of distinct values.

value string to use for the extra level name. If NULL, the extra level is created as NA,

and the result is the same as the one of the addNA function.

... arguments passed to addNA.

Value

an object of class "factor", original missing values being coded as an extra level named NA if as.string=FALSE, "NA" if as.string=TRUE, as specified by as.string if as.string is a string.

Source

Adapted from James (http://stackoverflow.com/a/5817181) by Joseph Larmarange <joseph@larmarange.net>

See Also

```
addNA (base).
```

Examples

```
f <- as.factor(c("a","b",NA,"a","b"))
f
addNAstr(f)
addNAstr(f, value="missing")
addNAstr(f, value=NULL)</pre>
```

4 chisq.residuals

		-		
ch	7	-	М	ren
CII	_	_	ч	1 61

A fertility survey - "children" table

Description

Some fictive results from a fecondity survey.

Usage

children

Format

a data frame containing one record for each child of the surveyed women in the fertility survey.

chisq.residuals

Return the chi-squared residuals of a two-way frequency table.

Description

Return the raw, standardized or Pearson's residuals (the default) of a chi-squared test on a two-way frequency table.

Usage

```
chisq.residuals(tab, digits = 2, std = FALSE, raw = FALSE)
```

Arguments

tab	frequency table
digits	number of digits to display
std	if TRUE, returns the standardized residuals. Otherwise, returns the Pearson residuals. Incompatible with raw.
raw	if TRUE, returns the raw (observed - expected) residuals. Otherwise, returns the Pearson residuals. Incompatible with std.

Details

This function is just a wrapper around the chisq.test base R function. See this function's help page for details on the computation.

See Also

chisq.test

clipcopy 5

Examples

```
## Sample table
data(Titanic)
tab <- apply(Titanic, c(1,4), sum)
## Pearson residuals
chisq.residuals(tab)
## Standardized residuals
chisq.residuals(tab, std = TRUE)
## Raw residuals
chisq.residuals(tab, raw = TRUE)</pre>
```

clipcopy

Transform an object into HTML and copy it for export

Description

This function transforms its argument to HTML with knitr::kable and then copy it to the clipboard or to a file for later use in an external application.

Usage

```
clipcopy(obj, ...)
## Default S3 method:
clipcopy(obj, append = FALSE, file = FALSE,
  filename = "temp.html", clipboard.size = 4096, ...)
## S3 method for class 'proptab'
clipcopy(obj, percent = NULL, digits = NULL,
  justify = "right", ...)
```

Arguments

obj	object to be copied
• • •	arguments passed to knitr::kable
append	if TRUE, append to the file instead of replacing it
file	if TRUE, export to a file instead of the clipboard
filename	name of the file to export to
clipboard.size	under Windows, size of the clipboard in kB
percent	whether to add a percent sign in each cell
digits	number of digits to display
justify	justification

Details

Under Linux, this function requires that xclip is installed on the system to copy to the clipboard.

6 cprop

Value

NULL

NULL

See Also

```
kable, format.proptab
clipcopy, format.proptab
```

Examples

```
data(iris)
tab <- table(cut(iris$Sepal.Length,8),cut(iris$Sepal.Width,4))
## Not run: copie(tab)
ptab <- rprop(tab, percent=TRUE)
## Not run: clipcopy(ptab)</pre>
```

cprop

Column percentages of a two-way frequency table.

Description

Return the column percentages of a two-way frequency table with formatting and printing options.

Usage

```
cprop(tab, ...)

## S3 method for class 'table'
cprop(tab, digits = 1, total = TRUE, percent = FALSE,
    drop = TRUE, n = FALSE, ...)

## S3 method for class 'data.frame'
cprop(tab, digits = 1, total = TRUE,
    percent = FALSE, drop = TRUE, n = FALSE, ...)

## S3 method for class 'matrix'
cprop(tab, digits = 1, total = TRUE,
    percent = FALSE, drop = TRUE, n = FALSE, ...)

## S3 method for class 'tabyl'
cprop(tab, digits = 1, total = TRUE, percent = FALSE,
    n = FALSE, ...)
```

cramer.v 7

Arguments

tab	frequency table
	parameters passed to other methods.
digits	number of digits to display
total	if TRUE, add a row with the sum of percentages and a column with global percentages $% \left(1\right) =\left(1\right) \left(1$
percent	if TRUE, add a percent sign after the values when printing
drop	if TRUE, lines or columns with a sum of zero, which would generate NaN percentages, are dropped.
n	if TRUE, display number of observations per column.

Value

The result is an object of class table and proptab.

See Also

```
rprop, prop, table, prop.table
```

Examples

```
## Sample table
data(Titanic)
tab <- apply(Titanic, c(4,1), sum)
## Column percentages
cprop(tab)
## Column percentages with custom display
cprop(tab, digits=2, percent=TRUE, total=FALSE)</pre>
```

cramer.v

Compute Cramer's V of a two-way frequency table

Description

This function computes Cramer's V for a two-way frequency table

Usage

```
cramer.v(tab)
```

Arguments

tab

table on which to compute the statistic

8 cross.multi.table

Examples

```
data(Titanic)
tab <- apply(Titanic, c(4,1), sum)
#' print(tab)
cramer.v(tab)</pre>
```

cross.multi.table

Two-way frequency table between a multiple choices question and a factor

Description

This function allows to generate a two-way frequency table from a multiple choices question and a factor. The question's answers must be stored in a series of binary variables.

Usage

```
cross.multi.table(df, crossvar, weights = NULL, digits = 1,
  freq = FALSE, tfreq = "col", n = FALSE, na.rm = TRUE, ...)
```

Arguments

df	data frame with the binary variables
crossvar	factor to cross the multiple choices question with
weights	optional weighting vector
digits	number of digits to keep in the output
freq	display percentages
tfreq	type of percentages to compute ("row" or "col")
n	if TRUE, and freq is TRUE, display number of observations per row or column
na.rm	Remove any NA values in crossvar
	arguments passed to multi.table

Details

See the multi.table help page for details on handling of the multiple choices question and corresponding binary variables.

If freq is set to TRUE, the resulting table gives the columns percentages based on the contingency table of crossvar in the respondants population.

Value

Object of class table.

describe 9

See Also

```
multi.table, multi.split, table
```

Examples

describe

Describe the variables of a data.frame

Description

This function describes the variables of a vector or a dataset that might include labels imported with **haven** packages.

Usage

```
describe(x, ...)
## S3 method for class 'factor'
describe(x, n = 10, show.length = TRUE,
    freq.n.max = 10, ...)
## S3 method for class 'numeric'
describe(x, n = 10, show.length = TRUE,
    freq.n.max = 10, ...)
## S3 method for class 'character'
describe(x, n = 10, show.length = TRUE,
    freq.n.max = 10, ...)
## Default S3 method:
describe(x, n = 10, show.length = TRUE,
    freq.n.max = 10, ...)
```

10 describe

```
## S3 method for class 'haven_labelled'
describe(x, n = 10, show.length = TRUE,
    freq.n.max = 10, ...)
## S3 method for class 'data.frame'
describe(x, ..., n = 10, freq.n.max = 0)
## S3 method for class 'description'
print(x, ...)
```

Arguments

x object to describe

... further arguments passed to or from other methods, see details

n number of first values to display show.length display length of the vector?

freq.n.max display a frequency table if the number of unique values is less than this value,

0 to hide

Details

When describing a data.frame, you can provide variable names as character strings. Using the "*" or "|" wildcards in a variable name will search for it using a regex match. The search will also take into account variable labels, if any. See examples.

Value

an object of class description.

Author(s)

Joseph Larmarange < joseph@larmarange.net>

lookfor

Examples

```
data(hdv2003)
describe(hdv2003$sexe)
describe(hdv2003$age)
data(fecondite)
describe(femmes$milieu)
describe(hdv2003)
describe(hdv2003, "cuisine", "heures.tv")
describe(hdv2003, "trav*")
describe(hdv2003, "trav|lecture")
```

duplicated2

```
describe(hdv2003, "trav", "lecture")
describe(femmes)
describe(femmes, "ident")
```

duplicated2

Determine all duplicate elements

Description

The native duplicated function determines which elements of a vector or data frame are duplicates of elements already observed in the vector or the data frame provided. Therefore, only the second occurence (or third or nth) of an element is considered as a duplicate. duplicated is similar but will also mark the first occurence as a duplicate (see examples).

Usage

```
duplicated2(x)
```

Arguments

Х

a vector, a data frame or a matrix

Value

A logical vector indicated wich elements are duplicated in x.

Source

```
http://forums.cirad.fr/logiciel-R/viewtopic.php?p=2968
```

See Also

duplicated

Examples

```
\label{eq:df} \begin{array}{l} df <- \mbox{ data.frame}(x=c("a","b","c","b","d","c"),y=c(1,2,3,2,4,3)) \\ df \\ duplicated(df) \\ duplicated2(df) \end{array}
```

12 fecondite

enfants

A fertility survey - "enfants" table

Description

Some fictive results from a fecondity survey.

Usage

enfants

Format

a data frame containing one record for each child of the surveyed women in the fecondite survey.

escape_regex

Escape regex special chars Code directly taken from Hmisc::escapeRegex

Description

Escape regex special chars Code directly taken from Hmisc::escapeRegex

Usage

```
escape_regex(s)
```

Arguments

s

string to escape regex special chars from

fecondite

A fertility survey

Description

Some fictive results from a fecondity survey, with French labels.

femmes 13

Format

3 data frames with labelled data (as if data would have been imported from SPSS with haven):

- menages contains some information from the households selected for the survey;
- femmes contains the questionnaire administered to all 15-49 years old women living in the selected households;
- enfants contains one record for each child of the surveyed women.

Data can be linked using the variables id_menage and id_femme.

See Also

fertility for an English version of this dataset.

Examples

```
data(fecondite)
describe(menages)
describe(femmes)
describe(enfants)
```

femmes

A fertility survey - "femmes" table

Description

Some fictive results from a fecondity survey.

Usage

femmes

Format

a data frame containing the questionnaire administered to all 15-49 years old women living in the selected households for the fecondite survey.

first_non_null

fertility

A fertility survey

Description

Some fictive results from a fecondity survey, with English labels.

Format

3 data frames with labelled data (as if data would have been imported from SPSS with haven):

- households contains some information from the households selected for the survey;
- women contains the questionnaire administered to all 15-49 years old women living in the selected households;
- children contains one record for each child of the surveyed women.

Data can be linked using the variables id_household and id_woman.

See Also

fecondite for an French version of this dataset.

Examples

```
data(fertility)
describe(households)
describe(women)
describe(children)
```

first_non_null

Return first non-null of two values

Description

Return first non-null of two values

Usage

```
x %||% y
```

Arguments

x first objecty second object

format.proptab 15

Description

Format an object of class proptab for printing depending on its attributes.

Usage

```
## S3 method for class 'proptab'
format(x, digits = NULL, percent = NULL,
    justify = "right", ...)
```

Arguments

X	object of class proptab
digits	number of digits to display
percent	if not NULL, add a percent sign after each value
justify	justification of character vectors. Passed to format.default
	other arguments to pass to format.default

Details

This function is designed for internal use only.

See Also

```
format.default, print.proptab
```

freq

Generate frequency tables.

Description

Generate and format frequency tables from a variable or a table, with percentages and formatting options.

Usage

```
freq(x, digits = 1, cum = FALSE, total = FALSE, exclude = NULL,
   sort = "", valid = !(NA %in% exclude), levels = c("prefixed",
   "labels", "values"), na.last = TRUE)
```

16 freq.na

Arguments

х	either a vector to be tabulated, or a table object
digits	number of digits to keep for the percentages
cum	if TRUE, display cumulative percentages
total	if TRUE, add a final row with totals
exclude	vector of values to exclude from the tabulation (if x is a vector)
sort	if specified, allow to sort the table by increasing ("inc") or decreasing ("dec") frequencies
valid	if TRUE, display valid percentages
levels	the desired levels for the factor in case of labelled vector (labelled package must be installed): "labels" for value labels, "values" for values or "prefixed" for labels prefixed with values
na.last	if TRUE, NA values are always be last table row

Value

The result is an object of class data.frame.

See Also

```
table, prop, cprop, rprop
```

Examples

```
# factor
data(hdv2003)
freq(hdv2003$qualif)
freq(hdv2003$qualif, cum = TRUE, total = TRUE)
freq(hdv2003$qualif, cum = TRUE, total = TRUE, sort ="dec")
# labelled data
data(fecondite)
freq(femmes$region)
freq(femmes$region, levels = "1")
freq(femmes$region, levels = "v")
```

freq.na

Generate frequency table of missing values.

Description

Generate a frequency table of missing values as raw counts and percentages.

Usage

```
freq.na(data, ...)
```

happy 17

Arguments

data either a vector or a data frame object

if x is a data frame, the names of the variables to examine or keywords to search

for such variables. See lookfor for more details.

Value

The result is an object of class data.frame.

See Also

```
table.is.na
```

Examples

```
data(hdv2003)
## Examine a single vector.
freq.na(hdv2003$qualif)
## Examine a data frame.
freq.na(hdv2003)
## Examine several variables.
freq.na(hdv2003, "nivetud", "trav.satisf")
## To see only variables with the most number of missing values
head(freq.na(hdv2003))
```

happy

Data related to happiness from the General Social Survey, 1972-2006.

Description

This data extract is taken from Hadley Wickham's productplots package. The original description follows, with minor edits.

The data is a small sample of variables related to happiness from the General Social Survey (GSS). The GSS is a yearly cross-sectional survey of Americans, run from 1972. We combine data for 25 years to yield 51,020 observations, and of the over 5,000 variables, we select nine related to happiness:

Format

A data frame with 51020 rows and 10 variables

Details

- age. age in years: 18–89.
- degree. highest education: It high school, high school, junior college, bachelor, graduate.
- finrela. relative financial status: far above, above average, average, below average, far below.

18 households

- happy. happiness: very happy, pretty happy, not too happy.
- health. health: excellent, good, fair, poor.
- marital. marital status: married, never married, divorced, widowed, separated.
- sex. sex: female, male.
- wtsall. probability weight. 0.43–6.43.

households

A fertility survey - "households" table

Description

Some fictive results from a fecondity survey.

Usage

households

Format

a data frame containing some information from the households selected for the fertility survey.

icut 19

icut

Interactive conversion from numeric to factor

Description

This function launches a shiny app in a web browser in order to do interactive conversion of a numeric variable into a categorical one.

Usage

```
icut(obj = NULL, var_name = NULL)
```

Arguments

obj vector to recode or data frame to operate on

var_name if obj is a data frame, name of the column to be recoded, as a character string

(possibly without quotes)

Value

The function launches a shiny app in the system web browser. The recoding code is returned in the console when the app is closed with the "Done" button.

Author(s)

Julien Barnier < julien.barnier@ens-lyon.fr>

Examples

```
## Not run: data(hdv2003)
icut(hdv2003, "age")
irec(hdv2003, heures.tv) ## this also works
## End(Not run)
```

ifunc_get_css

Returns custom CSS content

Description

Returns custom CSS content

Usage

```
ifunc_get_css()
```

20 iorder

ifunc_run_as_addin

Check if we are currently running as an rstudio addin

Description

Check if we are currently running as an rstudio addin

Usage

```
ifunc_run_as_addin()
```

ifunc_show_alert

Display an alert, only on first launch for the current session

Description

Display an alert, only on first launch for the current session

Usage

```
ifunc_show_alert(run_as_addin)
```

Arguments

run_as_addin

TRUE if the function is running as an rstudio addin

iorder

Interactive reordering of factor levels

Description

This function launches a shiny app in a web browser in order to do interactive reordering of the levels of a categorical variable (character or factor).

Usage

```
iorder(obj = NULL, var_name = NULL)
```

Arguments

obj vector to re

vector to recode or data frame to operate on

var_name

if obj is a data frame, name of the column to be recoded, as a character string

(possibly without quotes)

irec 21

Details

The generated convert the variable into a factor, as only those allow for levels ordering.

Value

The function launches a shiny app in the system web browser. The reordering code is returned in the console when the app is closed with the "Done" button.

Author(s)

Julien Barnier <julien.barnier@ens-lyon.fr>

Examples

```
## Not run: data(hdv2003)
iorder(hdv2003, "qualif")
## End(Not run)
```

irec

Interactive recoding

Description

This function launches a shiny app in a web browser in order to do interactive recoding of a categorical variable (character or factor).

Usage

```
irec(obj = NULL, var_name = NULL)
```

Arguments

obj vector to recode or data frame to operate on

var_name if obj is a data frame, name of the column to be recoded, as a character string

(possibly without quotes)

Value

The function launches a shiny app in the system web browser. The recoding code is returned in the console when the app is closed with the "Done" button.

Author(s)

Julien Barnier < julien.barnier@ens-lyon.fr>

22 lookfor

Examples

```
## Not run: data(hdv2003)
irec()
v <- sample(c("Red","Green","Blue"), 50, replace=TRUE)
irec(v)
irec(hdv2003, "qualif")
irec(hdv2003, sexe) ## this also works
## End(Not run)</pre>
```

lookfor

Look for keywords variable names and descriptions

Description

lookfor emulates the lookfor Stata command in R. It supports searching into the variable names of regular R data frames as well as into SPSS and Stata datasets loaded in R via the **haven**, in which case it will also search variable descriptions (labels). The command is meant to help users finding variables in large datasets.

Usage

```
lookfor(data, ..., labels = TRUE, ignore.case = TRUE,
  details = FALSE)
```

Arguments

data	a data frame
	list of keywords, a character string (or several character strings), which can be formatted as a regular expression suitable for a grep pattern, or a vector of keywords; displays all variables if not specified
labels	whether or not to search variable labels (descriptions); TRUE by default
ignore.case	whether or not to make the keywords case sensitive; TRUE by default (case is ignored during matching)
details	add details about each variable (see examples)

Details

The function looks into the variable names for matches to the keywords. If the data frame has been imported into R with **haven** package, then variable labels are included in the search scope. If **labelled** package is installed, variable labels of data.frame imported with **foreign** or **memisc** packages will also be taken into account.

Value

a data frame featuring the variable position, name and description (if it exists) in the original data frame

Itabs 23

Author(s)

François Briatte <f.briatte@gmail.com>

Source

Based on the behaviour of the lookfor command in Stata.

See Also

query in the memisc package

Examples

```
lookfor(iris)
# Look for a single keyword.
lookfor(iris, "petal")
lookfor(iris, "s")
# Look for with a regular expression
lookfor(iris, "petal|species")
lookfor(iris, "s$")
# Look for with several keywords
lookfor(iris, "pet", "sp")
lookfor(iris, "pet", "sp", "width")
# Load memisc package and example data.
## Not run: require(memisc)
nes1948.por <- UnZip("anes/NES1948.ZIP","NES1948.POR", package="memisc")</pre>
nes1948 <- spss.portable.file(nes1948.por)</pre>
# Look for a vector of keywords.
lookfor(nes1948, c("Truman", "Dewey"))
# Look for a regular expression.
lookfor(nes1948, "truman|dewey")
# Look for a phrase.
lookfor(nes1948, "personal attribute")
## End(Not run)
# Labelled data
data(fecondite)
lookfor(femmes)
lookfor(femmes, "date")
# Display details
lookfor(femmes, details = TRUE)
```

ltabs

Cross tabulation with labelled variables

Description

This function is a wrapper around xtabs, adding automatically value labels for labelled vectors if **labelled** package eis installed.

24 menages

Usage

```
ltabs(formula, data, levels = c("prefixed", "labels", "values"),
  variable_label = TRUE, ...)
```

Arguments

```
formula a formula object (see xtabs)
```

data a data frame

levels the desired levels in case of labelled vector: "labels" for value labels, "values"

for values or "prefixed" for labels prefixed with values

variable_label display variable label if available?

... additional arguments passed to xtabs

See Also

xtabs.

Examples

```
data(fecondite)
ltabs(~radio, femmes)
ltabs(~radio+tv, femmes)
ltabs(~radio+tv, femmes, "1")
ltabs(~radio+tv, femmes, "v")
ltabs(~radio+tv+journal, femmes)
ltabs(~radio+tv, femmes, variable_label = FALSE)
```

menages

A fertility survey - "menages" table

Description

Some fictive results from a fecondity survey.

Usage

menages

Format

a data frame containing some information from the households selected for the fecondite survey.

multi.split 25

				•	
mul	ŤΤ	•	n I	7	+
mul	C T		\mathbf{r}		L

Split a multiple choices variable in a series of binary variables

Description

Split a multiple choices variable in a series of binary variables

Usage

```
multi.split(var, split.char = "/", mnames = NULL)
```

Arguments

var variable to split split.char character to split at

mnames names to give to the produced variabels. If NULL, the name are computed from

the original variable name and the answers.

Details

This function takes as input a multiple choices variable where choices are recorded as a string and separated with a fixed character. For example, if the question is about the favourite colors, answers could be "red/blue", "red/green/yellow", etc. This function splits the variable into as many variables as the number of different choices. Each of these variables as a 1 or 0 value corresponding to the choice of this answer. They are returned as a data frame.

Value

Returns a data frame.

See Also

```
multi.table
```

Examples

```
v <- c("red/blue","green","red/green","blue/red")
multi.split(v)
## One-way frequency table of the result
multi.table(multi.split(v))</pre>
```

26 multi.table

mu]	t.1	. t.a	bΙε	

One-way frequency table for multiple choices question

Description

This function allows to generate a frequency table from a multiple choices question. The question's answers must be stored in a series of binary variables.

Usage

```
multi.table(df, true.codes = NULL, weights = NULL, digits = 1,
    freq = TRUE)
```

Arguments

df data frame with the binary variables

true.codes optional list of values considered as 'true' for the tabulation

weights optional weighting vector

digits number of digits to keep in the output

freq add a percentage column

Details

The function is applied to a series of binary variables, each one corresponding to a choice of the question. For example, if the question is about seen movies among a movies list, each binary variable would correspond to a movie of the list and be true or false depending of the choice of the answer.

By default, only '1' and 'TRUE' as considered as 'true' values fro the binary variables, and counted in the frequency table. It is possible to specify other values to be counted with the true.codes argument. Note than '1' and 'TRUE' are always considered as true values even if true.codes is provided.

If freq is set to TRUE, a percentage column is added to the resulting table. This percentage is computed by dividing the number of TRUE answers for each value by the total number of (potentially weighted) observations. Thus, these percentages sum can be greater than 100.

Value

Object of class table.

See Also

```
cross.multi.table, multi.split, table
```

na.rm 27

Examples

```
## Sample data frame
set.seed(1337)
sex <- sample(c("Man","Woman"),100,replace=TRUE)
jazz <- sample(c(0,1),100,replace=TRUE)
rock <- sample(c(TRUE, FALSE),100,replace=TRUE)
electronic <- sample(c("Y","N"),100,replace=TRUE)
weights <- runif(100)*2
df <- data.frame(sex,jazz,rock,electronic,weights)
## Frequency table on 'music' variables
multi.table(df[,c("jazz", "rock","electronic")], true.codes=list("Y"))
## Weighted frequency table on 'music' variables
multi.table(df[,c("jazz", "rock","electronic")], true.codes=list("Y"), weights=df$weights)
## No percentages
multi.table(df[,c("jazz", "rock","electronic")], true.codes=list("Y"), freq=FALSE)</pre>
```

na.rm

Remove observations with missing values

Description

na.rm is similar to na.omit but allows to specify a list of variables to take into account.

Usage

```
na.rm(x, v = NULL)
```

Arguments

x a data frame
v a list of variables

Details

If v is not specified, the result of na.rm will be the same as na.omit. If a list of variables is specified through v, only observations with a missing value (NA) for one of the specified variables will be removed from x. See examples.

Author(s)

Joseph Larmarange <joseph@larmarange.net>

See Also

na.omit

28 odds.ratio

Examples

```
df <- data.frame(x = c(1, 2, 3), y = c(0, 10, NA), z= c("a",NA,"b"))
df
na.omit(df)
na.rm(df)
na.rm(df, c("x","y"))
na.rm(df, "z")</pre>
```

odds.ratio

Odds Ratio

Description

S3 method for odds ratio

Usage

```
odds.ratio(x, ...)
## S3 method for class 'glm'
odds.ratio(x, level = 0.95, ...)
## S3 method for class 'multinom'
odds.ratio(x, level = 0.95, ...)
## S3 method for class 'factor'
odds.ratio(x, fac, level = 0.95, ...)
## S3 method for class 'table'
odds.ratio(x, level = 0.95, ...)
## S3 method for class 'matrix'
odds.ratio(x, level = 0.95, ...)
## S3 method for class 'numeric'
odds.ratio(x, y, level = 0.95, ...)
## S3 method for class 'numeric'
odds.ratio(x, y, level = 0.95, ...)
```

Arguments

```
x object from whom odds ratio will be computed
... further arguments passed to or from other methods
level the confidence level required
fac a second factor object
y a second numeric object
signif.stars logical; if TRUE, p-values are encoded visually as 'significance stars'
```

print.proptab 29

Details

For models calculated with glm, x should have been calculated with family=binomial. p-value are the same as summary(x)coefficients[,4]. Odds ratio could also be obtained with exp(coef(x)) and confidence intervals with exp(confint(x)).

For models calculated with multinom (nnet), p-value are calculated according to http://www.ats.ucla.edu/stat/r/dae/mlogit.htm.

For 2x2 table, factor or matrix, odds.ratio uses fisher.test to compute the odds ratio.

Value

Returns a data.frame of class odds.ratio with odds ratios, their confidence interval and p-values.

If x and y are proportions, odds.ratio simply returns the value of the odds ratio, with no confidence interval.

Author(s)

Joseph Larmarange <joseph@larmarange.net>

odds.ratio(reg)
odds.ratio(hdv2003$sport, hdv2003$cuisine)
odds.ratio(table(hdv2003$sport, hdv2003$cuisine))
M <- matrix(c(759, 360, 518, 363), ncol = 2)
odds.ratio(M)
odds.ratio(0.26, 0.42)</pre>
```

print.proptab

S3 print method for proptab objects.

Description

Print an object of class proptab.

30 prop

Usage

```
## S3 method for class 'proptab'
print(x, digits = NULL, percent = NULL,
    justify = "right", ...)
```

Arguments

X	object of class proptab
digits	number of digits to display
percent	if not NULL, add a percent sign after each value
justify	justification of character vectors. Passed to format.default
	other arguments to pass to format.default

See Also

format.proptab

prop

Global percentages of a two-way frequency table.

Description

Return the percentages of a two-way frequency table with formatting and printing options.

Usage

```
prop(tab, ...)

prop_table(tab, digits = 1, total = TRUE, percent = FALSE,
    drop = TRUE, n = FALSE, ...)

## S3 method for class 'data.frame'
prop(tab, digits = 1, total = TRUE,
    percent = FALSE, drop = TRUE, n = FALSE, ...)

## S3 method for class 'matrix'
prop(tab, digits = 1, total = TRUE, percent = FALSE,
    drop = TRUE, n = FALSE, ...)

## S3 method for class 'tabyl'
prop(tab, digits = 1, total = TRUE, percent = FALSE,
    n = FALSE, ...)
```

qload 31

Arguments

tab	frequency table
	parameters passed to other methods
digits	number of digits to display
total	if TRUE, add a column with the sum of percentages and a row with global percentages
percent	if TRUE, add a percent sign after the values when printing
drop	if TRUE, lines or columns with a sum of zero, which would generate NaN percentages, are dropped.
n	if TRUE, display number of observations per row and per column.

Value

The result is an object of class table and proptab.

See Also

```
rprop, cprop, table, prop. table
```

Examples

```
## Sample table
data(Titanic)
tab <- apply(Titanic, c(1,4), sum)
## Percentages
prop(tab)
## Percentages with custom display
prop(tab, digits=2, percent=TRUE, total=FALSE, n=TRUE)</pre>
```

qload

Load one or more packages, installing them first if necessary

Description

This function quickly loads one or more packages, installing them quietly if necessary.

Usage

```
qload(..., load = TRUE, silent = TRUE)
```

Arguments

• • •	the packages to load/install. Packages are loaded with library and installed first with install.packages if necessary.
load	load the packages. Set to FALSE to just install any missing packages. Defaults to TRUE.
silent	keep output as silent as possible. Defaults to TRUE.

32 gscan

Details

The function probably requires R 3.0.0 or above to make use of the quiet argument when calling install.packages. It is not clear what the argument previously achieved in older versions of R.

Value

The result is a list of packages cited in the scripts.

Author(s)

François Briatte <f.briatte@gmail.com>

See Also

```
qscan, install.packages, library
```

Examples

```
qload("questionr")
qload("questionr", silent = FALSE)
```

qscan

Scan R scripts and load/install all detected packages

Description

This function scans one or more R scripts and tries to quick-load/install the packages mentioned by library or require functions.

Usage

```
qscan(..., load = TRUE, detail = TRUE)
```

Arguments

... the scripts to scan. Defaults to all R scripts in the current working directory.

load quick-load/install the cited packages (see details). Defaults to TRUE. detail show the list of packages found in each script. Defaults to TRUE.

Details

The function calls the qload function to quick-load/install the packages.

Value

The result is a list of packages cited in the scripts.

quant.cut 33

Author(s)

François Briatte <f.briatte@gmail.com>

See Also

```
qload, library
```

Examples

```
## Scan the working directory.
## Not run: qscan()
```

quant.cut

Transform a quantitative variable into a qualitative variable

Description

This function transforms a quantitative variable into a qualitative one by breaking it into classes with the same frequencies.

Usage

```
quant.cut(var, nbclass, include.lowest = TRUE, right = FALSE,
  dig.lab = 5, ...)
```

Arguments

var variable to transform

nbclass number of classes

include.lowest argument passed to the cut function

right argument passed to the cut function

dig.lab argument passed to the cut function

arguments passed to the cut function

Details

This is just a simple wrapper around the cut and quantile functions.

Value

The result is a factor.

See Also

```
cut, quantile
```

34 recode.na

Examples

```
data(iris)
sepal.width3cl <- quant.cut(iris$Sepal.Width,3)
table(sepal.width3cl)</pre>
```

questionr	questionr	

Description

questionr

recode.na Recode values of a variable to missing values, using exact or regular expression matching.

Description

This function recodes selected values of a quantitative or qualitative variable by matching its levels to exact or regular expression matches.

Usage

```
recode.na(x, ..., verbose = FALSE, regex = TRUE, as.numeric = FALSE)
```

Arguments

Х	variable to recode. The variable is coerced to a factor if necessary.
• • •	levels to recode as missing in the variable. The values are coerced to character strings, meaning that you can pass numeric values to the function.
verbose	print a table of missing levels before recoding them as missing. Defaults to FALSE.
regex	use regular expressions to match values that include the "*" or "l" wildcards. Defaults to TRUE.
as.numeric	coerce the recoded variable to numeric. The function recommends the option when the recode returns only numeric values. Defaults to FALSE.

Value

The result is a factor with properly encoded missing values. If the recoded variable contains only numeric values, it is converted to an object of class numeric.

Author(s)

François Briatte <f.briatte@gmail.com>

rename.variable 35

See Also

regex

Examples

```
data(hdv2003)
## With exact string matches.
hdv2003$nivetud = recode.na(hdv2003$nivetud, "Inconnu")
## With regular expressions.
hdv2003$relig = recode.na(hdv2003$relig, "[A|a]ppartenance", "Rejet|NSP")
## Showing missing values.
hdv2003$clso = recode.na(hdv2003$clso, "Ne sait pas", verbose = TRUE)
## Test results with freq.
freq(recode.na(hdv2003$trav.satisf, "Equilibre"))
## Truncate a count variable (recommends numeric conversion).
freq(recode.na(hdv2003$freres.soeurs, 5:22))
```

rename.variable

Rename a data frame column

Description

Rename a data frame column

Usage

```
rename.variable(df, old, new)
```

Arguments

df data frame
old old name
new new name

Value

A data frame with the column named "old" renamed as "new"

Examples

```
data(iris)
str(iris)
iris <- rename.variable(iris, "Species", "especes")
str(iris)</pre>
```

36 rp2012

rm.unused.levels

Remove unused levels

Description

This function removes unused levels of a factor or in a data.frame. See examples.

Usage

```
rm.unused.levels(x, v = NULL)
```

Arguments

x a factor or a data frame

v a list of variables (optional, if x is a data frame)

Details

If x is a data frame, only factor variables of x will be impacted. If a list of variables is provided through v, only the unused levels of the specified variables will be removed.

Author(s)

Joseph Larmarange <joseph@larmarange.net>

Examples

```
df <- data.frame(v1=c("a","b","a","b"),v2=c("x","x","y","y"))
df$v1 <- factor(df$v1,c("a","b","c"))
df$v2 <- factor(df$v2,c("x","y","z"))
df
str(df)
str(rm.unused.levels(df))
str(rm.unused.levels(df,"v1"))</pre>
```

rp2012

2012 French Census - French cities of more than 2000 inhabitants

Description

Sample from the 2012 national french census. It contains results for every french city of more than 2000 inhabitants, and a small subset of variables, both in population counts and proportions.

Usage

rp2012

rp99

Format

A data frame with 5170 rows and 60 variables

Source

```
http://www.insee.fr/fr/bases-de-donnees/default.asp?page=recensements.htm
```

rp99

1999 French Census - Cities from the Rhône state

Description

Sample from the 1999 french census for the cities of the Rhône state.

Usage

rp99

Format

A data frame with 301 rows and 21 variables

Source

http://www.insee.fr/fr/bases-de-donnees/default.asp?page=recensements.htm

rprop

Row percentages of a two-way frequency table.

Description

Return the row percentages of a two-way frequency table with formatting and printing options.

Usage

```
rprop(tab, ...)
## S3 method for class 'table'
rprop(tab, digits = 1, total = TRUE, percent = FALSE,
    drop = TRUE, n = FALSE, ...)
## S3 method for class 'data.frame'
rprop(tab, digits = 1, total = TRUE,
    percent = FALSE, drop = TRUE, n = FALSE, ...)
```

38 tabs

```
## S3 method for class 'matrix'
rprop(tab, digits = 1, total = TRUE,
    percent = FALSE, drop = TRUE, n = FALSE, ...)
## S3 method for class 'tabyl'
rprop(tab, digits = 1, total = TRUE, percent = FALSE,
    n = FALSE, ...)
```

Arguments

tab	frequency table
	parameters passed to other methods.
digits	number of digits to display
total	if TRUE, add a column with the sum of percentages and a row with global percentages $$
percent	if TRUE, add a percent sign after the values when printing
drop	if TRUE, lines or columns with a sum of zero, which would generate NaN percentages, are dropped.
n	if TRUE, display number of observations per row.

Value

The result is an object of class table and proptab.

See Also

```
cprop, prop, table, prop. table
```

Examples

```
## Sample table
data(Titanic)
tab <- apply(Titanic, c(1,4), sum)
## Column percentages
rprop(tab)
## Column percentages with custom display
rprop(tab, digits=2, percent=TRUE, total=FALSE)</pre>
```

tabs

Weighted Crossresult

Description

Generate table with multiple weighted crossresult (full sample is first column). kable(), which is found in library(knitr), is recommended for use with RMarkdown.

tabs 39

Usage

```
tabs(df, x, y, type = "percent", percent = FALSE, weight = NULL,
normwt = FALSE, na.rm = TRUE, na.show = FALSE, exclude = NULL,
digits = 1)
```

Arguments

df	A data.frame that contains x and (optionally) y and weight.
x	variable name (found in df). $tabs(my.data, x = 'q1')$.
У	one (or more) variable names. $tabs(my.data, x = 'q1', y = c('sex', 'job')).$
type	'percent' (default ranges 0-100), 'proportion', or 'counts' (type of table returned).
percent	if TRUE, add a percent sign after the values when printing
weight	variable name for weight (found in df).
normwt	if TRUE, normalize weights so that the total weighted count is the same as the unweighted one
na.rm	if TRUE, remove NA values before computation
na.show	if TRUE, show NA count in table output
exclude	values to remove from x and y. To exclude NA, use na.rm argument.
digits	Number of digits to display; ?format.proptab for formatting details.

Details

tabs calls wtd.table on 'x' and, as applicable, each variable named by 'y'.

Author(s)

Pete Mohanty

Examples

```
data(hdv2003)
tabs(hdv2003, x = "relig", y = c("qualif", "trav.imp"), weight = "poids")
result <- tabs(hdv2003, x = "relig", y = c("qualif", "trav.imp"), type = "counts")
format(result, digits = 3)
# library(knitr)
# xt <- tabs(hdv2003, x = "relig", y = c("qualif", "trav.imp"), weight = "poids")
# kable(format(xt)) # to use with RMarkdown...</pre>
```

40 wtd.mean

women

A fertility survey - "women" table

Description

Some fictive results from a fecondity survey.

Usage

women

Format

a data frame containing the questionnaire administered to all 15-49 years old women living in the selected households for the fertility survey.

wtd.mean

Weighted mean and variance of a vector

Description

Compute the weighted mean or weighted variance of a vector.

Usage

```
wtd.mean(x, weights = NULL, normwt = "ignored", na.rm = TRUE)
```

Arguments

Numeric data vector

weights Numeric weights vector. Must be the same length as x

normwt Only for wtd.var, if TRUE then weights are normalized for the weighted count

to be the same as the non-weighted one

na.rm if TRUE, delete NA values.

Details

If weights is NULL, then an uniform weighting is applied.

Author(s)

These functions are exact copies of the wtd.mean and wtd.var function from the wtd.stats package. They have been created by Frank Harrell, Department of Biostatistics, Vanderbilt University School of Medicine, <f.harrell@vanderbilt.edu>.

wtd.table 41

See Also

```
mean, var, wtd. table and the survey package.
```

Examples

```
data(hdv2003)
mean(hdv2003$age)
wtd.mean(hdv2003$age, weights=hdv2003$poids)
var(hdv2003$age)
wtd.var(hdv2003$age, weights=hdv2003$poids)
```

wtd.table

Weighted one-way and two-way frequency tables.

Description

Generate weighted frequency tables, both for one-way and two-way tables.

Usage

```
wtd.table(x, y = NULL, weights = NULL, digits = 3, normwt = FALSE,
na.rm = TRUE, na.show = FALSE, exclude = NULL)
```

Arguments

X	a vector
У	another optional vector for a two-way frequency table. Must be the same length
	as x
weights	vector of weights, must be the same length as x
digits	Number of significant digits.
normwt	if TRUE, normalize weights so that the total weighted count is the same as the unweighted one
na.rm	if TRUE, remove NA values before computation
na.show	if TRUE, show NA count in table output
exclude	values to remove from x and y. To exclude NA, use na.rm argument.

Details

If weights is not provided, an uniform weighting is used.

Value

If y is not provided, returns a weighted one-way frequency table of x. Otherwise, returns a weighted two-way frequency table of x and y

42 wtd.table

See Also

wtd.table, table, and the survey package.

Examples
